***Reasons For Allowance***

The claimed invention in this case is a gas turbine engine which comprises apparatus for injecting a liquid (water) into air entering the engine's compressor. The claimed engine further comprises a fuel control unit having input parameters that include a first temperature measured upstream of the liquid injection apparatus, humidity measured upstream of the liquid injection apparatus, and a second temperature measured at the outlet of the turbine. Turbine engines with a similar combination of features are found in the prior art, as shown for example by the Kataoko et al Patent cited in the previous office action. Neither Kataoko nor any of the other references of record, however, show or fairly suggest a turbine engine with the above listed combination of features, and wherein, the control unit has all of the further limitations now recited in the amended claims (see claim 15, lines 20-25). These limitations require that the fuel control be configured to: determine a corrected value of the measured turbine outlet temperature as a function of compressor inlet temperature, compare the corrected turbine outlet temperature to a desired value of corrected turbine outlet temperature, and use the result of the comparison to produce a fuel control output. This is essentially a closed loop or feedback type fuel control based on corrected turbine outlet temperature, and the control systems in the cited references simply do not operate in this manner. The claimed invention is therefore considered patentable over the prior art.
